Town of Hague Japanese Knotweed Control Program

Japanese knotweed is an invasive plant that looks similar in appearance to bamboo. This plant quickly displace native plants. It overtakes and fills in abandoned and disturbed sites rapidly. Japanese knotweed is a problem for property owners because it quickly takes over their property. It also poses environmental problems such as stream bank erosion.

There is a significant Japanese Knotweed population along the Hague Creek corridor. Extending from the lake in the center of town up along W. Hague Rd. and Summit Dr. The Town of Hague has taken the initiative to control this knotweed.

In consideration for allowing control work to be done on your property the Town of Hague is covering the cost.

Please read this information and direct any questions to The Town of Hague

Japanese knotweed is controlled through application of a glyphosate based herbicide. The herbicide is applied via stem injection or foliar spray. Control on your property may also include cutting along with herbicide application.

Below is a list of herbicides:

One of these herbicides will be selected to treat your knotweed

Product	EPA Registration Number
RoundUp Custom	524-343
RoundUp Pro	524-475
Farmworks 41%	84009-12

Specific information about these and other pesticide products can be found at the NYS DEC Pesticide Information Portal. This can be found by searching the internet for NYSPAD.

On the back of this form, there is information about the certified pesticide applicator the town is working with along with more specific application information and a place for you to sign to allow control of Japanese Knotweed on your property.
